Re: Results of Phase II Environmental Site Assessment
1135 Sylvan Road
Atlanta, Fulton County, Georgia

Dear Mr. Donahue:

ENVIRONMENTAL TECHNOLOGY RESOURCES, INC., (ETRI) has completed a Phase II Environmental Site Assessment (ESA) of the property located at 1135 Sylvan Road in Atlanta, Fulton County, Georgia (“Site” or “subject property”). The location of the property is shown in Figure 1. This letter report presents the results of the Phase II ESA.

BACKGROUND INFORMATION

In May 2018, ETRI completed a Phase I ESA on the subject property. Historical research conducted as part of the Phase I ESA determined that the property was occupied by two commercial warehouses from at least 1932 until they were razed in 2004. The 1932 Sanborn map shows two commercial warehouses at the Site occupied by “Southern Paint Products Co. & Hughley Oil Co.”, a feed warehouse and auto garage. Southern Paint Products & Hughley Oil Co. remained on the Site in the 1978 Sanborn Map, along with a cotton warehouse. The facility name changed to Superior Sealants in 1986 and then to White Lightning Products in the early 1990s, both manufacturers of caulks, paints, and sealants. The buildings were vacated in the mid-1990s and remained unoccupied until they were eventually razed in 2004.

File reviews determined that investigations that were completed on the subject property in 1991 discovered the presence of polycyclic aromatic hydrocarbons (PAHs) and Lead in soil which exceeded the Georgia EPD Notification Concentration (NC’s). The concentrations of Lead in soils were as high as 3,500 mg/Kg. Four groundwater monitoring wells were installed as part of the investigations. Groundwater samples were collected and found to have detectable concentrations of Zinc, Copper and Bis (2-ethylhexyl) phthalate. Notification was made to the Georgia EPD and the EPD determined that a reportable quantity had not been released and issued a no listing letter for the site.

Based on our review of Sanborn maps dated 1932 and 1950, petroleum tanks were identified on the eastern (gasoline) and northwestern (oil) ends of the northern-most building and northwestern (gasoline) end of the southern building. The Sanborn maps do not indicate whether the tanks were underground or aboveground storage tanks. The Georgia EPD does not have a record of the tanks and no formal tank closure was submitted. Based on the prior use of the property, ETRI recommended completing a Phase II ESA of the property.

METHODS AND RESULTS OF INVESTIGATIONS

Groundwater Sampling and Analysis of Existing Monitoring Wells

Three groundwater monitoring wells were identified on the property during the initial Site visit. The monitoring wells included a well on the north-northwest side of the property (identified as MW-A), west side of the property (MW-B) and east-southeast side of the property (MW-C). MW-A was installed with a steel - standup pipe. MW-B and MW-C were installed with flush-mount vaults.

Depth to groundwater measurements were made using an electronic water level indicator graduated in hundredths of feet. The measuring point was a fixed point on the monitoring well from which all water level measurements were recorded. The measuring tape was cleaned prior to and after use with organic-free water. After donning a clean pair of gloves, the electronic water sensor was activated and slowly lowered into the monitoring well until an audio and visual response was identified. The tape was raised and lowered to confirm the water level detected.

Table 1 summarizes the depth to water readings and total depth of each well.

Table 1
Depth to Water Readings
1135 Sylvan Road, Atlanta, Georgia

Monitoring Well Number	Date	Depth to Water (ft)	Depth to Well (ft)
MW-A	May 21, 2018	12.59	24
MW-B	May 21, 2018	11.50	20
MW-C	May 21, 2018	12.29	20

Investigations completed in 1991 determined that the inferred groundwater flow direction at the Site is to the east-southeast.

Well purging and groundwater sampling was completed on May 21, 2018. Groundwater purging and sampling was conducted in accordance with the procedures described in the SESD Standard Operating Procedure titled: *Groundwater Sampling* (SESDPROC-301-R3), effective March 6, 2013.

Prior to sampling groundwater, each well was purged a minimum of five well volumes using purge pump. Groundwater was monitored for pH, temperature and turbidity. Purging continued until the pH and temperature stabilized and the turbidity was less than 10 NTU. The following summarizes the field parameters obtained for MW-A, MW-B and MW-C prior to sampling during the May 21, 2018 sampling event.

Temperature	17.9 ° C	17.5 ° C	17.5 ° C
Turbidity	7.76 NTU	9.83 NTU	7.28 NTU

Following sample collection, the bottles were placed in sealable plastic bubble wrap and stored on ice to maintain the sample at 4 degrees Celsius until they were delivered to the laboratory. The samples were maintained under proper chain-of-custody control from the time they were collected until they were relinquished to the laboratory. The groundwater samples were submitted to Analytical Environmental Services, Inc. of Atlanta, Georgia for analyses. The samples were analyzed for semi-volatile organic compounds (semi-VOC's) and total and dissolved, Copper, Lead and Zinc. The results of the groundwater sample analyses are summarized in **Table 3**. Monitoring well locations and the results of the sample analyses are shown in **Figure 2**.

Soil and Groundwater Investigations

ETRI installed eleven soil borings on the Site on June 1, 2018. ETRI retained the services of a geoprobe company (GeoLab Probing Services) to install the soil borings. The borings were installed using direct push methods, which involves hammering and/or pushing a hollow rod through the soil column using a hydraulic hammer designed for that purpose. A dual tube sampling method was used to collect the soil samples. The dual tube system allows for discrete sampling and minimizes cross contamination of soil samples.

All of the sampling equipment was decontaminated before arrival on the Site and between each borehole. Clean latex sample gloves were used when handling equipment, supplies, and soil samples. Decontamination procedures consisted of an Alconox detergent wash and a double rinse with clean water. Upon completion of the soil boring installation, all boreholes were backfilled with bentonite clay (which was hydrated by the addition of water) and

sealed with asphalt before leaving the Site.

Soil boring B1 was located on the northwest side of the property. Boring B2 and B3 were installed on the north and northwest sides of the property. Soil borings B4, B5, B6, B7 and B8 were installed in the mid-section of the property. Soil borings B9, B10 and B11 were installed on the eastern side of the property. Soil borings B1, B3 and B10 were installed in the area of former tanks that were once on the property. Soil boring locations are shown in **Figure 3**.

Soil borings were advanced from 20 to 25 feet. The soils were generally found to be reddish-brown clay loam in the upper eight to ten feet and reddish-brown/tan-brown sandy silt to ten to 13 feet. Reddish-brown/pink brown and tan-brown saprolite was found from ten to 10 feet. Brown and reddish-brown sandy silt soils were encountered from 20 to 25 feet. The soil samples were screened using a field calibrated, MiniRae 3000 photoionization detector (PID). The PID provides a general evaluation of the total volatile organics in the soils by measuring organics in air. By placing the soils in an enclosed container, the organics in the gaseous phase could be screened with the PID. Soil boring logs are included in **Attachment A**.

Soil samples from select borings for analyses. Samples were selected based on discoloration, odors or PID readings.

The soil samples collected from boring B1 at 8 to 102 feet, B2 from 0 to 2 feet and 15 to 17 feet, B3 at 0 to 2 feet, B4 from 0 to 2 feet, B5 from 0 to 2 feet, B6 at 1 to 3 feet, B7 from 5 to 8 feet, B8 from 0 to 3 feet, B9 from 0 to 2 feet and B10 from 8 to 10 feet. The samples were analyzed for polycyclic aromatic hydrocarbons and total Lead. Samples collected from B1 and B10 at 8 to 10 feet were also analyzed for Benzene, Toluene, Ethylbenzene and Xylenes (BTEX). The sample collected from B2 at 15 to 17 feet was analyzed for volatile organic compounds.

The samples were delivered to Analytical Environmental Services, Inc. of Atlanta, Georgia under proper chain-of-custody for analyses. Samples for volatile organic compounds analyses or BTEX analyses were analyzed using Method SW 8260B, PAHs using Method SW 8270D and total Lead using Method SW 6010.

The soil samples for VOC or BTEX analyses were collected using EPA Method 5035. These samples were preserved with Sodium bisulfite or Methanol then placed on ice. The results of the soil sample analyses are summarized in **Table 4** and the complete analytical report is included in **Attachment B**.

After collecting the soil samples from boring B1, B2 and B10, a groundwater sampling tool consisting of a telescopic four-foot length of wire mesh screen was inserted into a drive point rod. Given that a dual tube system of soil sample collection was being used, the wire mesh screen was advanced to the bottom of the outer MacroCore and the outer MacroCore was retracted by five feet exposing the screen to groundwater. The depth to groundwater was determined to be approximately 19.7 feet in B1, 17.2 feet in B2 and 22.1 feet in B10.

A groundwater sample was collected by lowering a disposable length of polyethylene tubing into the hollow rods and connecting the tubing to a peristaltic pump at the surface. Groundwater was then extracted using the peristaltic pump. Samples were transferred to the sample containers by discharging the groundwater into appropriate sample containers provided by the analytical laboratory. Following sample collection, the bottles were placed in sealable plastic bubble wrap and stored on ice in a cooler until they were transported to the laboratory. Approximately 0.3 to 0.5 gallon of groundwater was purged from each boring prior to collecting samples for analyses. The purging continued until the turbidity had significantly decreased.

The samples for BTEX or volatile organic compound analyses were placed in 40-mL vials containing hydrochloric acid as a preservative. Samples collected for polycyclic aromatic hydrocarbon (PAH) analyses were placed in amber, 40 mL glass containers. Samples for total and dissolved Lead were placed in preserved or unpreserved 200 mg/L polyethylene containers. The samples for total Lead analyses were preserved with hydrochloric acid. The samples were then placed on ice for preservation.

The groundwater samples were also delivered to Analytical Environmental Services, Inc. under proper chain of custody. The groundwater samples were analyzed for BTEX or VOC's using Method 8260B, PAHs using Method 8270C and total and dissolved Lead using Method 6010. **Table 5** is a summary of the analyses of the groundwater samples.

DISCUSSION OF RESULTS

The results of the soil and groundwater investigations completed at 1135 Sylvan Road determined the following:

- No detectable concentrations of VOC's/BTEX or PAHs were present in soil samples collected in the area of the former petroleum storage tanks.
- No detectable concentrations of VOC's/BTEX or PAHs were present in groundwater samples collected in the area of the former petroleum storage tanks.
- The concentrations of total Lead detected in soils ranged from 5.11 mg/Kg to 187 mg/Kg. The Georgia EPD Notification Concentration for Lead is 400 mg/Kg.
- PAHs were detected in soil samples collected from boring B3 at 0-2 feet, B7 at 5-8 feet, B8 at 0-3 feet and B9 at 0-2 feet. The concentrations of PAHs detected in B3, B7 and B8 were below Georgia EPD Notification Concentrations. Benzo(a)pyrene and Benzo(b) fluoranthene were detected in the sample collected from boring B9 at 0 to 2 feet above the Georgia EPD Notification Concentrations and above Type 1/3 Risk Reduction Standards.

Under the Georgia Hazardous Site Response Act, notification to the Georgia EPD is required when concentrations of contaminants in soils exceed notification concentrations. Petroleum releases are exempt from notification under HSRA. The concentrations of Benzo(a)pyrene and Benzo(b) fluoranthene exceeded the NC. In 1995, notification of a release of Benzo(b) fluoranthene along with other PAHs and Lead was made to the Georgia EPD. Benzo(a)pyrene was not one of the PAHs reported.

Notification is also required when groundwater contamination exceeds EPA Maximum Contaminant Levels (MCL's). No VOC's or PAHs were detected in the groundwater samples therefore, notification is not required.
